Noah Shaw

Full-Stack Software Engineer

(505) 377-7011 | noah.w.shaw@gmail.com | github.com/DaylightNebula | Portfolio

SUMMARY

Full-stack engineer with 5+ years building backend services, data-heavy APIs, and React/Astro web apps for platforms serving millions of users. Known for JVM performance work, microservice architecture, and production AI features, typically as one of 1–3 engineers owning the full stack on AWS and bare metal.

TECHNICAL SKILLS

Languages: Java, Kotlin, TypeScript, JavaScript, Rust, C, Python
Frontend: React, Astro
Backend: API design, microservice architecture, JVM performance tuning, Consul, TCP/WebSocket networking
Databases: PostgreSQL, MySQL, MongoDB, Redis
DevOps & Cloud: AWS, bare-metal hosting, Docker, Jenkins, GitHub Actions, CI/CD, automated testing
AI: LLM integration for content moderation, automated bug triage and PR generation, user-facing AI features

EXPERIENCE

Systems Solutions — Contract Software Developer — Oct 2025 – Present
Remote · Large-scale Minecraft server network with millions of players

- Maintain and modernize a large legacy Java/Kotlin codebase serving tens of thousands of daily users.
- Cut server boot times in half and significantly reduced runtime of network-wide workloads, such as updating every active entity across the server network; JVM optimizations have at times outperformed equivalent Rust implementations.
- Develop against production databases with tables exceeding 10M rows.
- Built AI systems for chat moderation (flagging only), automated bug-report handling that generates pull requests, and user-facing features that make the game world feel more alive.
- Built testing tooling for legacy systems without CI/CD, enabling the testing team to scale substantially and sharply reducing bugs reaching production.
- Design and ship custom game modes; document all changes for engineers, the business, and users.

TechnoClash LLC — Contract Software Developer — Mar 2025 – Oct 2025
Remote · Minecraft server network

- Developed and maintained a network of microservices and databases powering custom multiplayer game modes.
- Built and maintained CI/CD pipelines and automated testing.
- Designed and implemented custom game modes in Java/Kotlin, with documentation for the development team, the business, and users.

Daylin Software House — Independent Contractor — Nov 2024 – Mar 2025

- Ran an independent contracting business with short client engagements; closed it after accepting new roles.

MC Legion Games / Starfury Contracting — Full-Stack Software Developer — Jun 2021 – Oct 2024
Remote · Web platform and Minecraft server network; project moved between companies, role unchanged

- Architected and maintained microservice backends ranging from 2 to 24 services.
- Built analytics APIs that efficiently query 100K+ user records.
- Built user-facing APIs and React/Astro web features letting users search and interact with their own and other users' data.
- Built APIs that let game servers gather player data and assemble game state as fast as possible before each match.
- Established CI/CD pipelines and testing practices; documented code and changes affecting users and operations.

EDUCATION

University of Colorado Denver — Bachelor's in Computer Science — Denver, CO

PROJECTS

Anarchy (Rust) — Fast, scalable entity-component-system (ECS) for Rust physics simulations and games; simulated 100K+ asteroids simultaneously in solar-system simulations. GitHub

Daylin Microservices (Docker, Consul) — Family of libraries forming the core of production-ready microservices, built to run in Docker with Consul service discovery; fully documented for other developers. GitHub

Meld (Custom game server) — Highly customizable, efficient Minecraft server implementation using proven TCP networking techniques and a modular design for developer extensions. GitHub

Nebulous Engine (Rust, Bevy) — Thread-safe, documented Bevy engine tooling with TCP/WebSocket networking for cross-platform peer-to-peer and client/server games. GitHub
