Noah Shaw

Backend & Full-Stack Software Engineer

(505) 377-7011 | noah.w.shaw@gmail.com | github.com/DaylightNebula | Portfolio

SUMMARY

Backend and full-stack engineer with 5+ years building distributed JVM services, high-throughput data APIs and React/Astro web platforms for systems serving millions of users. Specializes in runtime performance engineering, microservice architecture and LLM-integrated pipelines, typically as one of 1–3 engineers owning the full stack from bare metal and AWS to the browser.

TECHNICAL SKILLS

Languages: Java, Kotlin, TypeScript, JavaScript, Rust, C, Python
Backend: Distributed systems, microservices, API design, JVM performance tuning, concurrency, Consul, TCP/WebSocket
Data: PostgreSQL, MySQL, MongoDB, Redis
Frontend: React, Astro
DevOps & Cloud: AWS, bare-metal hosting, Docker, Jenkins, GitHub Actions, CI/CD, regression testing
AI: LLM pipeline integration for content validation, autonomous bug triage and PR generation

EXPERIENCE

Systems Solutions — Contract Full-Stack Software Engineer — Oct 2025 – Present
Remote · Distributed real-time platform with millions of registered users and tens of thousands daily

- Cut service bootstrap times by 50% and sharply reduced cluster-wide batch workload runtimes through JVM runtime and memory-management tuning, at times outperforming equivalent Rust implementations.
- Modernize a large legacy Java/Kotlin codebase serving tens of thousands of daily active users, engineering against production tables of 10M+ rows.
- Designed LLM-integrated pipelines for real-time content validation with human-in-the-loop review, autonomous bug triage that opens pull requests, and AI-driven user-facing features.
- Built isolated test harnesses and regression environments for legacy services with no CI/CD, scaling the QA team's validation throughput and sharply reducing defects reaching production.
- Own new services from design through release, documented for engineering, business stakeholders and users.

TechnoClash LLC — Contract Software Engineer — Mar 2025 – Oct 2025
Remote · Distributed real-time platform

- Built and operated a microservice and database tier orchestrating multi-tenant session state for concurrent users.
- Built CI/CD pipelines and automated test suites that gate every deployment, reducing release risk.
- Designed and implemented new backend services in Java/Kotlin, documented for engineering, the business and users.

Daylin Software House — Independent Contractor — Nov 2024 – Mar 2025

- Ran an independent software contracting business with short client engagements; closed it after accepting new roles.

MC Legion Games / Starfury Contracting — Full-Stack Software Engineer — Jun 2021 – Oct 2024
Remote · Web platform and distributed real-time backend; project moved between companies, role unchanged

- Architected microservice backends that grew from 2 to 24 services, owning boundaries, data stores and inter-service APIs.
- Built analytics APIs that query 100K+ user records efficiently.
- Built low-latency state-aggregation APIs that assemble each session's state from user records before it starts.
- Built search and data-access APIs with React/Astro frontends over users' own and shared data.
- Established CI/CD pipelines and testing practices; documented changes affecting users and operations.

EDUCATION

University of Colorado Denver — Bachelor's in Computer Science — Denver, CO

PROJECTS

Gearbox / Anarchy (Rust, WGPU) — Lock-granular concurrent ECS runtime that sustained 100K+ simulated entities: per-component borrow flags so systems contend only on shared data, chunked columnar storage and deterministic headless runs for regression testing. GitHub

Daylin Microservices (Kotlin, Ktor, Consul, Docker) — Service-mesh framework with self-registration, cached service discovery, schema-validated RPC and typed cross-service errors; published on JitPack. GitHub

Shader Magician (Rust, proc macros) — Rust-to-WGSL compiler as an attribute macro, a WGSL parser/printer, and a GPU abstraction layer; validated against real GPU compute output. GitHub

Meld (Kotlin, TCP) — Protocol-level TCP server for a third-party binary protocol, with every subsystem down to authentication a hot-swappable module. GitHub
